KANI JOURNAL OF SOCIAL SCIENCES (KJSS)

ARTIFICIAL INTELLIGENCE (AI) POLICY

1. AUTHORSHIP & ACCOUNTABILITY

- **No AI Authorship:** Generative Artificial Intelligence tools, Large Language Models (LLMs), and automated writing assistants (e.g., ChatGPT, Claude, Copilot) do not satisfy the criteria for academic authorship. They cannot be listed as authors or co-authors on any manuscript submitted to KJSS.
- **Author Responsibility:** Authors maintain sole accountability for the originality, accuracy, integrity, and ethical compliance of their entire manuscript, including any text, data, code, or citations generated or assisted by AI tools.

2. PERMISSIBLE & IMPERMISSIBLE USES OF AI

- **Permissible Assistance:**
  - Using AI-based language editing software (e.g., Grammarly, language polishers) to improve readability, grammar, or spelling.
  - Utilizing AI tools for standard data processing, statistical analysis, or code generation, provided the underlying methodology is transparently documented.
- **Impermissible Uses:**
  - Generating core scientific hypotheses, analytical conclusions, literature syntheses, or entire sections of text without human oversight and substantial intellectual contribution.
  - Fabricating or falsifying empirical data, references, or study participants through AI models.

3. MANDATORY DISCLOSURE REQUIREMENT

If AI or AI-assisted technologies were utilized in the conceptualization, data processing, literature analysis, drafting, or editing of the manuscript, authors must include an explicit **Declaration of AI Use** in the manuscript methods or acknowledgement section prior to peer review. The disclosure must detail:

1. The specific tool/model used (including version/release date).
2. The exact scope and purpose of its application within the research or writing process.

4. USE OF AI BY PEER REVIEWERS & EDITORS

- **Confidentiality Restrictions:** Peer reviewers and editors are strictly prohibited from uploading submitted manuscripts, abstract drafts, or unpublished data into external AI tools or LLMs. Doing so violates confidentiality protocols, author copyright, and data privacy rights.

- **Human-Driven Assessment:** Peer review evaluations and editorial publication decisions must be conducted entirely through independent human assessment and professional academic judgment. AI tools may not be used to generate reviewer evaluations or editorial decision notices.
